

Helium and thermal energy

Chemistry, life, the universe & everything - Cooper & Klymkowsky

Q 1

- Draw a picture of what you imagine solid Helium looks like.

Q 1

- Draw a picture of what you imagine solid Helium looks like.

Q 2

- What is preventing the He atoms from flying apart? (why do they stick together?)
- Draw a picture of two or three He atoms showing the forces that are attracting them to each other

Q 2

- What is preventing the He atoms from flying apart? (why do they stick together?)
- London dispersion forces

Q 3

- What happens when you add thermal energy (raise the temperature) to the Helium atoms? Why?
- The kinetic energy of the molecules increases, they move faster, collide and/or vibrate with more energy.

Q4: How to the He atoms “know” the

The energy is transferred from other atoms that have collided with the walls of the container, that were directly heated.

Chemistry, life, the universe & everything - Cooper & Klymkowsky

Q 4

- Compared to Ne you think the London Dispersion forces between Xe atoms are
 - A. larger
 - B. Smaller
 - C. The same?

Chemistry, life, the universe & everything - Cooper & Klymkowsky

Q5

- Which do you think would have larger melting and/or boiling points

- A. Ne
- B. Xe
- C. Same

Chemistry, life, the universe & everything - Cooper & Klymkowsky

Helium has a melting point of 1K,
and Xenon has a melting point of
161K. Was your prediction right?

Chemistry, life, the universe & everything - Cooper & Klymkowsky

London Dispersion Forces

- Increase with size of particle (number of electrons)
- Increase with surface area
- Part of a range of intermolecular forces (between particles)

Chemistry, life, the universe & everything - Cooper & Klymkowsky

Q 6

- If a container with He solid in it is heated (for example by placing the container on a heated block), the solid will melt and then evaporate. Draw a diagram showing how the energy from the solid block is transferred to the He atoms.

Chemistry, life, the universe & everything - Cooper & Klymkowsky

Q7

Draw a graph showing how the potential energy of a two Helium atom system changes as the He atoms approach each other. Use a solid line for He. Now, using the same graph, and using a dotted line ——— show how the potential energy changes when two Xe atoms approach each other. Explain how and why the two curves differ from each other.

Chemistry, life, the universe & everything - Cooper & Klymkowsky

A range of interactions between atoms

- van der Waals – can be between atoms or molecules – (intermolecular)
- Bonds – more permanent – stronger harder to break.

Chemistry, life, the universe & everything - Cooper & Klymkowsky
